- 21** Adding the two equations and dividing by 10, we get : $x+y = 10$ $\frac{1}{2}$
 Subtracting the two equations and dividing by -2, we get : $x-y = 1$ $\frac{1}{2}$
 Solving these two new equations, we get, $x = \frac{11}{2}$ $\frac{1}{2}$
 $y = \frac{9}{2}$ $\frac{1}{2}$

22 In $\triangle ABC$,
 $\angle 1 = \angle 2$
 $\therefore AB = BD$ (i) $\frac{1}{2}$
 Given,
 $AD/AE = AC/BD$
 Using equation (i), we get $\frac{1}{2}$
 $AD/AE = AC/AB$ (ii)
 In $\triangle BAE$ and $\triangle CAD$, by equation (ii),
 $AC/AB = AD/AE$ $\frac{1}{2}$
 $\angle A = \angle A$ (common)
 $\therefore \triangle BAE \sim \triangle CAD$ [By SAS similarity criterion] $\frac{1}{2}$

23 $\angle PAO = \angle PBO = 90^\circ$ (angle b/w radius and tangent) $\frac{1}{2}$
 $\angle AOB = 105^\circ$ (By angle sum property of a triangle) $\frac{1}{2}$
 $\angle AQB = \frac{1}{2} \times 105^\circ = 52.5^\circ$ (Angle at the remaining part of the circle is half the angle subtended by the arc at the centre) 1

24 We know that, in 60 minutes, the tip of minute hand moves 360°
 In 1 minute, it will move $= 360^\circ / 60 = 6^\circ$ $\frac{1}{2}$
 \therefore From 7 : 05 pm to 7: 40 pm i.e. 35 min, it will move through $= 35 \times 6^\circ = 210^\circ$ $\frac{1}{2}$
 \therefore Area of swept by the minute hand in 35 min = Area of sector with sectorial angle θ
 of 210° and radius of 6 cm
 $= \frac{210}{360} \times \pi \times 6^2$ $\frac{1}{2}$
 $= \frac{7}{12} \times \frac{22}{7} \times 6 \times 6$
 $= 66\text{cm}^2$ $\frac{1}{2}$

OR

Let the measure of $\angle A, \angle B, \angle C$ and $\angle D$ be $\theta_1, \theta_2, \theta_3$ and θ_4 respectively
 Required area = Area of sector with centre A + Area of sector with centre B
 + Area of sector with centre C + Area of sector with centre D $\frac{1}{2}$

$$\begin{aligned}
&= \frac{\theta_1}{360} \times \pi \times 7^2 + \frac{\theta_2}{360} \times \pi \times 7^2 + \frac{\theta_3}{360} \times \pi \times 7^2 + \frac{\theta_4}{360} \times \pi \times 7^2 & 1/2 \\
&= \frac{(\theta_1 + \theta_2 + \theta_3 + \theta_4)}{360} \times \pi \times 7^2 \\
&= \frac{(360)}{360} \times \frac{22}{7} \times 7 \times 7 \text{ (By angle sum property of a triangle)} & 1/2 \\
&= 154 \text{ cm}^2 & 1/2
\end{aligned}$$

- 25 $\sin(A+B)=1 = \sin 90$, so $A+B = 90$(i) 1/2
 $\cos(A-B)=\sqrt{3}/2 = \cos 30$, so $A-B= 30$(ii) 1/2
From (i) & (ii) $\angle A = 60^\circ$ 1/2
And $\angle B = 30^\circ$ 1/2

OR

$$\begin{aligned}
\frac{\cos\theta - \sin\theta}{\cos\theta + \sin\theta} &= \frac{1-\sqrt{3}}{1+\sqrt{3}} \\

\frac{1 - \tan\theta}{1 + \tan\theta} &= \frac{1-\sqrt{3}}{1+\sqrt{3}} & 1/2 \\
\text{Which on simplification (or comparison) gives } \tan\theta &= \sqrt{3} & 1/2 \\
\text{Or } \theta &= 60^\circ & 1/2
\end{aligned}$$

SECTION - C

- 26 Let us assume $5 + 2\sqrt{3}$ is rational, then it must be in the form of p/q where p and q are co-prime integers and $q \neq 0$ 1
- i.e $5 + 2\sqrt{3} = p/q$ 1/2
- So $\sqrt{3} = \frac{p-5q}{2q}$(i) 1/2
- Since $p, q, 5$ and 2 are integers and $q \neq 0$, HS of equation (i) is rational. But LHS of (i) is $\sqrt{3}$ which is irrational. This is not possible. 1/2
- This contradiction has arisen due to our wrong assumption that $5 + 2\sqrt{3}$ is rational. So, $5 + 2\sqrt{3}$ is irrational. 1/2
- 27 Let α and β be the zeros of the polynomial $2x^2 - 5x - 3$ 1/2
Then $\alpha + \beta = 5/2$ 1/2
And $\alpha\beta = -3/2$. 1/2
Let 2α and 2β be the zeros $x^2 + px + q$ 1/2
Then $2\alpha + 2\beta = -p$ 1/2
 $2(\alpha + \beta) = -p$
 $2 \times 5/2 = -p$
So $p = -5$ 1/2
And $2\alpha \times 2\beta = q$ 1/2
 $4\alpha\beta = q$
So $q = 4 \times -3/2$
 $= -6$ 1/2

- 28 Let the actual speed of the train be x km/hr and let the actual time taken be y hours. 1/2
Distance covered is xy km
If the speed is increased by 6 km/hr, then time of journey is reduced by 4 hours i.e.,
when speed is $(x+6)$ km/hr, time of journey is $(y-4)$ hours.
 \therefore Distance covered $= (x+6)(y-4)$
 $\Rightarrow xy = (x+6)(y-4)$
 $\Rightarrow -4x + 6y - 24 = 0$ 1/2
 $\Rightarrow -2x + 3y - 12 = 0 \dots\dots\dots(i)$
Similarly $xy = (x-6)(y+6)$
 $\Rightarrow 6x - 6y - 36 = 0$
 $\Rightarrow x - y - 6 = 0 \dots\dots\dots(ii)$ 1/2
Solving (i) and (ii) we get $x=30$ and $y=24$ 1
Putting the values of x and y in equation (i), we obtain
Distance $= (30 \times 24) \text{ km} = 720 \text{ km}$. 1/2
Hence, the length of the journey is 720 km.

OR

- Let the number of chocolates in lot A be x 1/2
And let the number of chocolates in lot B be y
 \therefore total number of chocolates $= x+y$
Price of 1 chocolate = ₹ $\frac{2}{3}$, so for x chocolates $= \frac{2}{3}x$
and price of y chocolates at the rate of ₹ 1 per chocolate $= y$.
 \therefore by the given condition $\frac{2}{3}x + y = 400$ 1/2
 $\Rightarrow 2x + 3y = 1200 \dots\dots\dots(i)$
Similarly $x + \frac{4}{5}y = 460$ 1/2
 $\Rightarrow 5x + 4y = 2300 \dots\dots\dots(ii)$
Solving (i) and (ii) we get
 $x=300$ and $y=200$
 $\therefore x+y = 300+200 = 500$ 1
So, Anuj had 500 chocolates. 1/2

- 29 LHS : $\frac{\sin^3\theta / \cos^3\theta}{1 + \sin^2\theta / \cos^2\theta} + \frac{\cos^3\theta / \sin^3\theta}{1 + \cos^2\theta / \sin^2\theta}$ 1/2

$$\begin{aligned}
&= \frac{\sin^3\theta / \cos^3\theta}{(\cos^2\theta + \sin^2\theta)/\cos^2\theta} + \frac{\cos^3\theta / \sin^3\theta}{(\sin^2\theta + \cos^2\theta)/\sin^2\theta} \\
&= \frac{\sin^3\theta}{\cos\theta} + \frac{\cos^3\theta}{\sin\theta} && \frac{1}{2} \\
&= \frac{\sin^4\theta + \cos^4\theta}{\cos\theta\sin\theta} && \frac{1}{2} \\
&= \frac{(\sin^2\theta + \cos^2\theta)^2 - 2\sin^2\theta\cos^2\theta}{\cos\theta\sin\theta} && \frac{1}{2} \\
&= \frac{1 - 2\sin^2\theta\cos^2\theta}{\cos\theta\sin\theta} && \frac{1}{2} \\
&= \frac{1}{\cos\theta\sin\theta} - \frac{2\sin^2\theta\cos^2\theta}{\cos\theta\sin\theta} \\
&= \sec\theta\csc\theta - 2\sin\theta\cos\theta && \frac{1}{2} \\
&= \text{RHS}
\end{aligned}$$

Let ABCD be the rhombus circumscribing the circle with centre O, such that AB, BC, CD and DA touch the circle at points P, Q, R and S respectively.

We know that the tangents drawn to a circle from an exterior point are equal in length.

$$\therefore AP = AS \dots\dots\dots(1)$$

$$BP = BQ \dots\dots\dots(2)$$

$$CR = CQ \dots\dots\dots(3)$$

$$DR = DS \dots\dots\dots(4).$$

Adding (1), (2), (3) and (4) we get

$$AP+BP+CR+DR = AS+BQ+CQ+DS$$

$$(AP+BP) + (CR+DR) = (AS+DS) + (BQ+CQ)$$

$$\therefore AB+CD=AD+BC \dots\dots\dots(5)$$

Since AB=DC and AD=BC (opposite sides of parallelogram ABCD)

putting in (5) we get, $2AB=2AD$

or $AB = AD$.

$$\therefore AB=BC=DC=AD$$

Since a parallelogram with equal adjacent sides is a rhombus, so ABCD is a rhombus

OR

Join OC

In $\triangle OPA$ and $\triangle OCA$

$OP = OC$ (radii of same circle)

$PA = CA$ (length of two tangents from an external point)

1

$AO = AO$ (Common)

Therefore, $\triangle OPA \cong \triangle OCA$ (By SSS congruency criterion)

$\frac{1}{2}$

Hence, $\angle 1 = \angle 2$ (CPCT)

$\frac{1}{2}$

Similarly $\angle 3 = \angle 4$

$\angle PAB + \angle QBA = 180^\circ$ (co interior angles are supplementary as $XY \parallel X'Y'$)

$\frac{1}{2}$

$$2\angle 2 + 2\angle 4 = 180^\circ$$

$$\angle 2 + \angle 4 = 90^\circ \text{-----(1)}$$

$\frac{1}{2}$

$$\angle 2 + \angle 4 + \angle AOB = 180^\circ \text{ (Angle sum property)}$$

Using (1), we get, $\angle AOB = 90^\circ$

SECTION D

- 32** Let the time taken by larger pipe alone to fill the tank = x hours
Therefore, the time taken by the smaller pipe = $x+10$ hours

$\frac{1}{2}$

Water filled by larger pipe running for 4 hours = $\frac{4}{x}$ litres

Water filled by smaller pipe running for 9 hours = $\frac{9}{x+10}$ litres

We know that

$$\frac{4}{x} + \frac{9}{x+10} = \frac{1}{2}$$

Which on simplification gives:

$$x^2 - 16x - 80 = 0$$

$$x^2 - 20x + 4x - 80 = 0$$

$$x(x-20) + 4(x-20) = 0$$

$$(x+4)(x-20) = 0$$

$$x = -4, 20$$

x cannot be negative.

$$\text{Thus, } x = 20$$

$$x + 10 = 30$$

Larger pipe would alone fill the tank in 20 hours and smaller pipe would fill the tank alone in 30 hours.

OR

Let the usual speed of plane be x km/hr

and the reduced speed of the plane be (x-200) km/hr

Distance = 600 km [Given]

According to the question,

(time taken at reduced speed) - (Schedule time) = 30 minutes = 0.5 hours.

$$\frac{600}{x-200} - \frac{600}{x} = \frac{1}{2}$$

Which on simplification gives:

$$x^2 - 200x - 240000 = 0$$

$$x^2 - 600x + 400x - 240000 = 0$$

$$x(x-600) + 400(x-600) = 0$$

$$(x-600)(x+400) = 0$$

$$x = 600 \text{ or } x = -400$$

But speed cannot be negative.

∴ The usual speed is 600 km/hr and

the scheduled duration of the flight is $\frac{600}{600} = 1$ hour

33 For the Theorem :

Given, To prove, Construction and figure

Proof

Let ABCD be a trapezium $DC \parallel AB$ and EF is a line parallel to AB and hence to DC.

To prove : $\frac{DE}{EA} = \frac{CF}{FB}$

Construction : Join AC, meeting EF in G.

Proof :

In $\triangle ABC$, we have

$GF \parallel AB$

$$CG/GA = CF/FB \quad [\text{By BPT}] \quad \dots\dots(1) \quad \frac{1}{2}$$

In $\triangle ADC$, we have

$$EG \parallel DC \quad (EF \parallel AB \text{ \& } AB \parallel DC) \quad \frac{1}{2}$$

$$DE/EA = CG/GA \quad [\text{By BPT}] \quad \dots\dots(2)$$

From (1) & (2), we get,

$$\frac{DE}{EA} = \frac{CF}{FB} \quad \frac{1}{2}$$

34. Radius of the base of cylinder (r) = 2.8 m = Radius of the base of the cone (r)

Height of the cylinder (h)=3.5 m

Height of the cone (H)=2.1 m.

Slant height of conical part (l)= $\sqrt{r^2+H^2}$

$$= \sqrt{(2.8)^2+(2.1)^2} \quad 1$$

$$= \sqrt{7.84+4.41}$$

$$= \sqrt{12.25} = 3.5 \text{ m} \quad 1$$

$$\text{Area of canvas used to make tent} = \text{CSA of cylinder} + \text{CSA of cone} \quad 1$$

$$= 2 \times \pi \times 2.8 \times 3.5 + \pi \times 2.8 \times 3.5$$

$$= 61.6+30.8$$

$$= 92.4\text{m}^2 \quad 1$$

1

$$= 1500 \times 120 \times 92.4$$

$$= 16,632,000$$

$$\text{Share of each school to set up the tents} = 16632000/50 = ₹332,640$$

SA for second new solid (S_2):

1

$$\text{Median} = l + \frac{\frac{n}{2} - cf}{f} \times h$$

$\frac{1}{2}$

Since, $l=500$, $h=100$, $f=20$, $cf=36+x$ and $n=100$

Therefore, putting the value in the Median formula, we get;

$$525 = 500 + \frac{50 - (36+x)}{20} \times 100$$

$\frac{1}{2}$

$$\text{so } x = 9$$

$$y = 24 - x \text{ (from eq.i)}$$

$$y = 24 - 9 = 15$$

Therefore, the value of $x = 9$
